

# Ball joints/ Rótulas

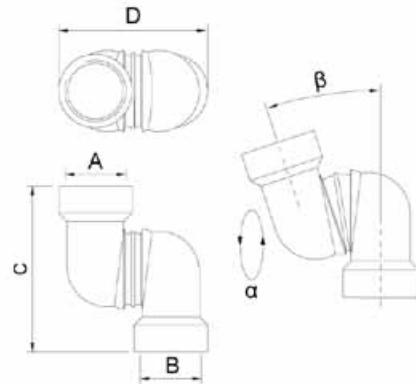

**B**all joints are used to achieve the desired inclination of water jets in architectural fountains. On occasions the installation of hydraulic components does not achieve the vertical orientation or the angle necessary for the fountain nozzles to operate correctly. There are **three types of articulated joints**:

- **360° around an axis** and 19° crosswise to this axis.
- **A sphere or ball type** that allows fountain nozzles to be perfectly adjusted to vertical, or parabolic water jets to be achieved
- **Adjustable flange type**. Less volume and weight but less angle of inclination.
